

Slimmer Product Review

The Wear Ease Slimmer Camisole has pockets already made into the garments for the insertion of prosthesis. The fabric content: Bust: 92% polyester, 8% Spandex, Body: 80% Nylon, 20% Spandex. This cami is the only one we have found to have an "A" line profile, being slightly wider at the hip, and longer than most cami's, and having no problems in "riding up," which we have found with some of the other cami's if they are not "tucked in." It is also cut higher in the front, under the arms and on the back than most cami's we have reviewed, which we find wonderful for truncal lymphedema. Please go to [WearEase Slimmer Camisole](#) to see 360 degree photos. We have found the shoulder straps very comfortable. The (retail) price is in the range of \$50.00.

We have found this camisole extremely comfortable, easy to wear all day and to sleep in, and the prosthesis pockets can be used to hold [Swell Spots™](#) in place during sleep or during the day, whether you have had reconstruction or not.

Review by Binney: (double mastectomy, no reconstruction) The fabric is lovely and very comfortable, but with enough body to do some serious work at controlling truncal swelling. The bottom stays in place without rolling, and there's no "band" below the breast area to block lymph flow. Prostheses slip in very easily and stay in place well, and the coverage under the arm and around on the back is excellent. It's cut high in front too, which is a real advantage for controlling swelling higher on the chest, but it does mean that the top shows with even a moderately low-cut shirt. Thinking of it as a part of a chic "layered look" can make the high neckline a deliberate fashion choice instead of an unfortunate medical necessity. You might even stop by your local fabric store and pick out a lace inset to give the neckline added appeal. (To maintain the compression, tack it lightly in a couple of spots along the neck instead of sewing it in place with a line of stitches). As an added bonus: this really is a "slimmer" for hips and tummy as well.

Review by OneBadBoob: (single mastectomy with TRAM reconstruction) This is one comfortable cami! One of the reasons I love it is that it does not "ride up" at all. I agree with everything Binney has said. I actually like the higher cut on the chest, since I can wear it under jackets and shirts, with buttons open, and not show any "cleavage" but just a pretty black cami underneath. And with all of the "heat" our compression garments can add, I am happy not to have to add an additional camisole or "dickie" to cover the cleavage area.

Compression Bra Review

Reviewed by Binney: Silky, easy-to-wear fabric combines with a soft, wide bottom band to give this bra a very high rating for comfort. The discreet front zipper has an underlining to protect sensitive skin, the prosthesis pockets are well-designed and very easy to use, and the straps adjust at the shoulder with small and secure hooks instead of the usual stiff and bulky Velcro. The sizes range from XXSmall to 3X, so there's something for just about everyone. Pair this with a Silique Comfort-Lite breast form for a fit that looks great and feels even better, with none of the lymphedema discomfort that heavier forms can cause.
